Abstracts

Surgical Gloves are personal protection equipment (PPE) designed to protect clinicians in operating room (OR) environments. The primary purpose of surgical gloves is to act as a protective barrier for surgeons and nurses to prevent possible transmission of diseases or pathogens during procedures while working with surgical instruments. Similar to medical examination glove, surgical glove standards are governed by the Food and Drug Administration (FDA) within the United States. However, the FDA requires manufacturers to meet a higher level of quality standards for surgical gloves. All surgical gloves are sterilized and package sealed in pairs for individual use. The sterilization of surgical gloves is standard as surgical procedures often involve open wound operation. Today, surgical gloves are made from a variety of materials which include latex, polyisoprene, neoprene, and nitrile. Surgical Gloves are more difficult to produce because they need two molds instead of one, the fingertips need to be bent, sterilization is a bigger issue and thickness is higher.

The global Surgical Gloves market size was estimated at USD 1748.15 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 0.08% during the forecast period.
