Report Overview

Surgical sutures are medical devices used to hold body tissues together after an injury or surgery, facilitating the healing process by approximating wound edges. They consist of a needle attached to a thread, which can be made from absorbable materials (such as polyglycolic acid or catgut) that degrade naturally within the body over time, or non-absorbable materials (like silk, nylon, or polypropylene) that require manual removal post-healing. Sutures are classified based on their structure (monofilament or multifilament), absorption properties, and coating (to reduce tissue drag or enhance antimicrobial properties). The choice of suture depends on factors such as wound type, tissue location, required tensile strength, and healing duration. Advanced sutures may incorporate antimicrobial agents or bioactive coatings to minimize infection risks and promote faster recovery. The market is driven by increasing surgical volumes, rising demand for minimally invasive procedures, and advancements in biocompatible materials.

The global Surgical Suture market size was estimated at USD 3802.53 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.13% during the forecast period.
