Abstracts

Surgical valves are prosthetic devices used in open-heart surgery to replace or repair damaged heart valves. These can be either mechanical valves (made of durable materials such as titanium or carbon) or biological valves (derived from bovine or porcine tissues). Surgical valves are often implanted in patients who are undergoing valve replacement surgery due to disease or dysfunction.

Market Overview:The surgical valve market is one of the largest segments in the heart valve replacement industry. Both mechanical and biological surgical valves are used based on patient age, lifestyle, and medical condition. While mechanical valves are preferred in younger patients due to their longer lifespan, biological valves are commonly used for elderly patients due to their better compatibility and lower risk of blood clot formation.

Market Drivers:Rising incidence of heart valve diseases, especially in elderly populations. Technological advancements in valve materials, including more durable and biocompatible solutions. Increasing use of minimally invasive surgical techniques, such as robotic-assisted surgeries.

Market Opportunities:Innovations in mechanical and bioprosthetic valve technologies to increase longevity and reduce complications. Growth in developing countries, where healthcare infrastructure is improving and the prevalence of heart disease is rising.

Market Limitations:The high cost of valve replacement surgeries, especially for advanced biological valves. Concerns regarding long-term durability of biological valves, which could lead to a need for reoperation.

The global Surgical Valves market size was estimated at USD 6581.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
