Abstracts

Survey and exploration satellite imagery is high-precision imagery of the Earth's surface acquired using satellite-borne optical, radar, or multispectral sensors. It is widely used in geological exploration, mineral resource surveys, oil and gas pipeline monitoring, and disaster assessment. Gross profit margins vary significantly depending on the technical complexity. High-resolution optical imaging services can achieve a gross profit margin of 30%-40%, while basic geological survey imagery boasts a gross profit margin of approximately 15%-20%, primarily influenced by data accuracy, update frequency, and algorithm complexity. The upstream sector involves satellite manufacturing and launch, involving companies such as China Aerospace Science and Technology Corporation and Lockheed Martin, with a focus on breakthroughs in high-resolution sensors and low-cost, rapid launch technologies. The midstream sector involves data processing and platform development, supporting the Ministry of Natural Resources' geological disaster early warning system. The downstream sector includes industry applications, covering areas such as mineral exploration (e.g., Zijin Mining's use of satellite imagery to identify hidden ore bodies), oil and gas monitoring (e.g., CNOOC's use of SAR imagery to track offshore platform subsidence), and geological hazard assessment (e.g., the Ministry of Emergency Management's use of multi-temporal imagery to analyze landslide deformation).

The global Survey and Exploration Satellite Imagery market size was estimated at USD 895.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
