Abstracts

Sustainable Drainage Systems (SuDS) refer to a set of water management practices and infrastructure designed to manage surface water runoff in a way that mimics natural drainage processes, reducing the impact of urbanization on the water cycle by promoting infiltration, evapotranspiration, harvesting, and attenuation of rainwater rather than directing it swiftly to sewers or watercourses. These systems include features such as permeable pavements, green roofs, swales, retention basins, and rain gardens, which collectively aim to improve water quality, reduce flood risk, enhance biodiversity, and integrate water management with urban design and landscaping.

The global Sustainable Drainage Systems market size was estimated at USD 4850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
