Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Sustainable Microfibrillated Cellulose competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Sustainable microfibrillated cellulose (MFC) is a renewable, biodegradable, and high-performance biomaterial derived from plant-based cellulose fibers?typically sourced from wood pulp or agricultural residues?through mechanical or chemical processes that reduce them to nano- or microscale fibrils. Characterized by its high surface area, strong hydrogen bonding ability, and excellent mechanical properties, MFC serves as a sustainable alternative to petroleum-based polymers in a wide range of applications. It is commonly used as a reinforcing agent in composites, a rheology modifier in paints and coatings, a barrier enhancer in sustainable packaging, and a thickener in personal care or food products. As a bio-based material with a low carbon footprint and excellent recyclability or compostability, sustainable MFC contributes to greener manufacturing and supports the shift toward circular and environmentally responsible product design.

The global Sustainable Microfibrillated Cellulose market size was estimated at USD 427.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
