Abstracts

Short-wave Infrared imaging (SWIR), is an advanced technique, used for producing images based on radiation in the region of the electromagnetic spectrum invisible to the naked eye. SWIR cameras are used for a variety of applications in different aspects of the industry and research, ranging from inspection, quality control, identification, detection, surveillance, and more. System integrators are increasingly developing new inspection systems as they come down in price, system integrators are increasingly developing new inspection systems based on shortwave infrared (SWIR) line scan cameras. SWIR cameras are not new, but advances in sensor technology recently have made them more practical in applications including silicon inspection, laser beam profiling, hyperspectral imaging, chemical and plastics sensing, and medical imaging. The SWIR spectrum -- wavelengths between 900 and 2500 nm -- detects features not immediately obvious in visible light. It is especially effective in food inspection involving moisture detection, for example, separating frozen fruit from plastic pieces that may be mixed in, or in identifying the fat content of meat. To a frame grabber, the data coming from the camera, be it SWIR, MWIR, Visible etc., is the same. We have always been able to process this data. However in recent times, the increase in data output by these cameras has required the use of a frame grabber. BitFlow has partnered with several companies manufacturing these cameras ensuring these customers have access to the best frame grabbers in the market.

The global SWIR Cameras market size was estimated at USD 90.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
