Report Overview

Switched Filter Banks consist of a combination of switches and filters integrated in to a single module. These usually consist of an input switch followed by a filter for each channel of the switch, followed by an output switch. Integrating filter and switch components in a module eliminates transitions between circuits, providing for optimal matching which results in better insertion loss, flatness, VSWR and overall better performance of the device. The use of internal channelization also allows for optimum rejection and isolation. Since all the components are integrated in to a single module, Switched Filter banks are compact and save a considerable amount of board space.
