Abstracts

Swivel joints for loading arms are essential components in the loading and unloading operations of various fluids, such as oil, gas, and chemicals. These joints are designed to provide rotational flexibility to the loading arms, allowing them to move freely in different directions while maintaining a secure connection. They are typically made of high - quality materials like stainless steel or alloy steel to withstand the harsh conditions often associated with these substances, including high pressure, corrosion, and abrasion.A swivel joint for a loading arm consists of multiple rotating parts that are precisely engineered to ensure smooth rotation and minimal leakage. The inner and outer races of the joint are designed to handle the axial and radial loads that occur during the operation of the loading arm. This enables the loading arm to be positioned accurately for efficient transfer of fluids between storage tanks and transport vehicles, such as trucks, trains, or ships.

The global Swivel Joints for Loading Arm market size was estimated at USD 1264.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.50% during the forecast period.
