The Tonggansu integrated computing solution is a comprehensive information technology solution that integrates sensing technologies (sensors, IoT devices), data communication networks, and computing and analytical capabilities. It aims to achieve efficient connectivity and intelligent management between the physical and digital worlds. This solution uses various sensors to collect multi-dimensional data on the environment, equipment, and personnel in real time, transmitting it via high-speed networks to edge or cloud computing platforms. Integrating artificial intelligence, big data analytics, and digital twin technologies, it enables real-time data processing, predictive analysis, and decision support. This provides end-to-end intelligent, automated, and visualized services for scenarios such as industrial manufacturing, urban management, energy monitoring, transportation and logistics, and smart campuses. This helps businesses and organizations improve operational efficiency, reduce costs, optimize resource allocation, and enhance security and responsiveness. The Tonggansu integrated computing solution's downstream customers primarily include industrial manufacturers, smart city operators, energy and power companies, transportation and logistics management agencies, building and campus managers, and public safety and environmental monitoring departments. In specific applications, industrial enterprises can use this solution to implement equipment status monitoring, predictive maintenance, and production optimization; smart cities and industrial parks can perform environmental sensing, energy management, and traffic scheduling; energy companies can monitor and optimize power generation, transmission and distribution, and energy consumption data in real time; logistics companies can achieve intelligent scheduling and full-process tracking through vehicle, warehouse, and cargo sensing data; and public safety and environmental protection agencies can enhance emergency response capabilities through real-time sensing and data analysis. Through these

downstream applications, the Tonggansu integrated solution forms an end-to-end value chain that closes the loop of data collection, transmission, computing, and analysis. The Tonggansu integrated solution has a gross profit margin of 72%. The integrated solution of tele-sensing and computing is the key driving force for the development of intelligent technology in the future. It integrates the three core technologies of communication, perception and computing, seamlessly integrates the originally scattered perception data, information transmission and intelligent decision-making, and greatly improves the intelligence and response speed of the system. In the context of the rapid development of the digital economy and the Internet of Things, the traditional decentralized architecture has been unable to meet the needs of real-time processing of massive data. The integration of tele-sensing and computing not only solves this bottleneck, but also optimizes resource scheduling, data processing and decision-making efficiency through the collaboration of edge computing, cloud computing and 5G technologies. This solution has broad application prospects in the fields of intelligent manufacturing, autonomous driving, smart cities, etc., and can promote comprehensive upgrades from production processes to urban management. In the future, with the further evolution of AI technology, the integration of tele-sensing and computing will achieve stronger adaptive capabilities and higher levels of intelligence, thereby greatly improving the operational efficiency and innovation capabilities of all walks of life and promoting the process of global digital transformation.
