Abstracts

Synthesis polypeptide drugs are pharmaceutical compounds consisting of artificially produced chains of amino acids, typically ranging from 10 to 50 residues, designed to mimic or enhance the biological functions of natural peptides for therapeutic purposes. These molecules occupy a unique niche between small-molecule drugs and large biologics, offering advantages such as high specificity, potent activity, and relatively lower immunogenicity compared to proteins, while still allowing for rational design and chemical synthesis rather than recombinant expression. Their applications span a broad range of therapeutic areas, including oncology (e.g., peptide hormone analogs and targeted cytotoxics), metabolic disorders (e.g., GLP-1 receptor agonists for diabetes), infectious diseases (e.g., antimicrobial peptides), and central nervous system disorders, with ongoing innovation in stabilization technologies?such as cyclization, PEGylation, and non-natural amino acid incorporation?to overcome inherent limitations like poor oral bioavailability and short plasma half-life.

The global Synthesis Polypeptide Drugs market size was estimated at USD 6850.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.15% during the forecast period.
