Report Overview

Synthetic Adhesion Barriers are medical devices designed to prevent or reduce the formation of postoperative adhesions, which are abnormal fibrous connections between tissues that can occur after surgery. These barriers are typically made from synthetic materials, such as polymers, and are placed between tissues or organs during surgical procedures to create a physical barrier that inhibits the growth of adhesions. The primary purpose of synthetic adhesion barriers is to improve patient outcomes by reducing complications associated with adhesions, such as pain, bowel obstruction, and infertility. They are used in various surgical applications, including gynecological, abdominal, and pelvic surgeries, and are often biodegradable, allowing them to be absorbed by the body over time without the need for removal.
