## Abstracts

The development trend for synthetic bone graft materials is focused on improving their biocompatibility, osteoconductivity, and osteoinductivity. Researchers are working on developing synthetic bone graft materials that closely mimic the natural composition and structure of bone. This includes using bioactive materials that can integrate with the surrounding bone tissue without causing adverse reactions or immune responses. Synthetic bone graft materials are being designed to have a porous structure that allows for the infiltration of blood vessels and bone cells. This promotes the growth of new bone tissue and facilitates the integration of the graft with the host bone. The ability to induce the differentiation of stem cells into bone-forming cells is a crucial aspect of synthetic bone graft materials. Researchers are exploring various strategies to enhance the osteoinductive properties of these materials, such as incorporating growth factors or bioactive molecules that can stimulate bone regeneration.

The global Synthetic Bone Graft Material market size was estimated at USD 2925.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
