Abstracts

Synthetic coumarin powder is an organic chemical compound produced industrially through chemical synthesis, primarily via the Perkin reaction or other modern synthetic pathways, serving as a cost-effective and consistent alternative to natural coumarin extracted from plants like tonka beans. It is characterized by its sweet, hay-like aroma and is widely utilized as a fragrance ingredient and flavoring agent in perfumes, cosmetics, soaps, detergents, and tobacco products, despite regulatory restrictions in food applications in many regions due to hepatotoxicity concerns. The market for synthetic coumarin is driven by demand from the fragrance and flavor industries, where it is valued for its stability, uniformity, and economic scalability compared to natural variants, though it faces challenges related to health regulations and growing consumer preference for natural ingredients in some segments.

The global Synthetic Coumarin Powder market size was estimated at USD 75.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
