Abstracts

Synthetic flushing fluid is a specialized chemical formulation engineered to remove contaminants, sludge, varnish, and other deposits from mechanical and hydraulic systems without the use of petroleum-based solvents. It is typically applied during maintenance or repair procedures to clean internal components?such as engines, transmissions, power steering systems, and hydraulic circuits?before fresh lubricants or hydraulic fluids are introduced. Unlike conventional flushing agents, synthetic variants are designed to be compatible with a wide range of seal materials and system components, offering enhanced thermal stability, lower environmental impact, and reduced risk of residue formation. These fluids often incorporate synthetic base oils and advanced additive packages that provide effective cleaning while ensuring protection against corrosion and wear during the flushing process.

The global Synthetic Flushing Fluid market size was estimated at USD 120.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
