Report Overview:

Synthetic graphite materials is a man-made substance manufactured by the high temperature processing of amorphous carbon materials. The types of amorphous carbon used as precursors to graphite are many, and can be derived from petroleum, coal, or natural and synthetic organic materials. In some cases, graphite can even be manufactured by the direct precipitation of graphitic carbon from pyrolysis of a carbonaceous gas such as acetylene (pyrolytic graphite). One important commonality between all graphite precursors is that they must contain carbon. Graphite is carbon, a specific form of carbon, so it can only be derived from other carbon containing substances. Although Synthetic Graphite Materials can be manufactured from any number of precursor materials, the primary material used to manufacture it in the United States is petroleum coke. As noted above only certain types of carbonaceous feeds are suitable for graphite production. Therefore, the petroleum coke used for the Synthetic Graphite Materials industry must be carefully specified to assure it is of the type that will ultimately result in high quality graphitic carbon.

The Global Synthetic Graphite Materials Market Size was estimated at USD 6120.39 million in 2023 and is projected to reach USD 8248.89 million by 2029, exhibiting a CAGR of 5.10% during the forecast period.
