Report Overview

Synthetic Polycrystalline Diamond is a man-made diamond material composed of numerous small diamond crystals fused together, typically through high-pressure, high-temperature (HPHT) processes or chemical vapor deposition (CVD). PCD exhibits extreme hardness, toughness, and wear resistance, making it ideal for industrial applications such as cutting, grinding, and drilling. It is classified into PCD and thermally stable polycrystalline diamond (TSP). PCD refers to polycrystalline diamond sintered with a metallic binder, which enhances its toughness but limits its thermal stability. In contrast, TSP diamonds are specially treated to remove the binder, increasing their thermal stability for high-temperature applications. Both PCD and TSP are essential in industries that require materials with exceptional durability and performance.
