Report Overview

Synthetic ultramarine pigment is a blue inorganic pigment synthesized by chemical methods. Its name comes from the Middle Latin ultramarinus, which means 'beyond the sea'. It was named because it was imported from Asia by sea in the early days. Synthetic ultramarine pigment is a blue pigment produced by a series of chemical reactions using specific chemicals such as aluminum sulfate, sodium sulfate and sodium sulfide sulfate to simulate or surpass the color characteristics of natural ultramarine pigment. Compared with natural ultramarine, synthetic ultramarine has advantages in color brightness, particle fineness, impurity content, etc., so it has been widely used in modern industrial production. With the continuous advancement of science and technology and the improvement of environmental awareness, the production process and quality of synthetic ultramarine pigment will continue to be improved and optimized. In the future, synthetic ultramarine pigment is expected to be applied and promoted in more fields, adding more color and beauty to people's living and working environment.
