Abstracts

A syphon pump is a device used to transfer liquids from one container to another using the principle of siphoning. It consists of a tube or hose that is inserted into the liquid to be transferred, with one end placed in the source container and the other end in the destination container. By creating a pressure difference between the two ends of the tube, typically by sucking on one end or using a hand pump, the liquid flows through the tube from the higher container to the lower container. Syphon pumps are commonly used for tasks such as transferring fuel, water, or other liquids between containers, draining aquariums, or emptying flooded areas.

The global Syphon Pump market size was estimated at USD 1273.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
