Report Overview

A syphon pump is a device used to transfer liquids from one container to another using the principle of siphoning. It consists of a tube or hose that is inserted into the liquid to be transferred, with one end placed in the source container and the other end in the destination container. By creating a pressure difference between the two ends of the tube, typically by sucking on one end or using a hand pump, the liquid flows through the tube from the higher container to the lower container.
