Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Syrup for Brewing Beer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Beer syrup is a new type of starch syrup suitable for brewer's yeast fermentation. This syrup can increase the concentration of wort, reduce the color of beer, improve the taste of beer, and reduce production costs. Beer syrup uses maltose as the main ingredient, has low protein, low polyphenols, and contains certain minerals, so it is not easy to produce pigments during the fermentation process. It is suitable for refreshing beer and new beer. There are two main types of syrups used in the beer industry. One is syrup produced from pure corn starch, such as maltose syrup, high maltose syrup, fructose syrup, oligosaccharide syrup, etc.; the other is syrup made from barley as the main raw material, corn starch or corn (sometimes part of malt) as auxiliary raw materials, and various enzyme preparations are added to decompose barley, and then concentrated and refined. Syrup is mainly selected according to the purpose of use and the requirements for beer quality. Using syrup can reduce costs.

The global Syrup for Brewing Beer market size was estimated at USD 1580.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
