Report Overview

A system boiler hot water cylinder is a water container that holds hot water under extreme pressure, drains it and provides instant hot water when a hot water faucet or appliance is turned on. Since the system is fully pressurized, there is no need to vent it to the atmosphere. System boiler hot water cylinders are a favorite among homeowners with pressurized central heating. When equipped with an external or built-in expansion vessel, a non-vented cylinder is especially desirable, saving domestic users space in the home as hot water is delivered under pressure and does not require bulky gravity cold water supply cylinders. Conversely, system boiler hot water cylinders feed directly from the cold water line, and since the water line enters at high pressure, flow and consistency from unvented cylinders tends to be more reliable.

The global System Boiler Hot Water Cylinders market size was estimated at USD 1250.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
