Abstracts

Tactical inertial systems are self-contained navigation devices that utilize accelerometers and gyroscopes to measure changes in velocity and orientation, providing continuous position, velocity, and attitude data without reliance on external signals like GPS. These systems are critical for applications requiring high reliability and autonomy in GPS-denied or degraded environments, commonly integrated into military platforms such as missiles, unmanned aerial vehicles (UAVs), ground vehicles, and dismounted soldiers for precise guidance, stabilization, and navigation. The market is driven by increasing defense expenditures globally, technological advancements in micro-electromechanical systems (MEMS) and fiber-optic gyroscopes (FOGs), and growing demand for autonomous systems, though it faces challenges related to high costs, complex integration, and the need for continuous calibration and error compensation. Key players include established defense contractors and specialized technology firms, with innovation focused on enhancing accuracy, reducing size, weight, and power (SWaP), and improving affordability for broader deployment.

The global Tactical Inertial Systems market size was estimated at USD 1855.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
