Abstracts

A tactile vibration motor is a micro motor used to generate tactile feedback. It simulates physical touch through vibration and is widely used in consumer electronics, automobiles, medical and gaming equipment. It can generate vibrations of different frequencies, intensities and patterns according to the input signal, providing users with an immersive interactive experience, such as mobile phone notifications, game vibration feedback, smart watch reminders, etc. According to the technology type, tactile vibration motors can be divided into eccentric rotor motors (ERM) and linear resonance motors (LRA). Among them, LRA has gradually become the mainstream due to its fast response speed and low energy consumption.

The global Tactile Vibration Motor market size was estimated at USD 750.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
