Abstracts

Organic light-emitting diodes (OLEDs) have great application prospects in flat-panel displays and solid-state lighting. As the third-generation OLEDs, TADF materials have a maximum exciton utilization rate of 100%, which has attracted extensive attention in the industry. At present, TADF-based OLEDs have achieved high external quantum efficiency, but like phosphorescent OLEDs, most of the TADF molecules need to be doped in the host material. Thermally Activated Delayed Fluorescence (TADF) dopant materials, as a novel type of organic luminescent materials, have garnered significant attention in the field of organic optoelectronics. The market for these materials is gradually expanding, primarily applied in areas like organic light-emitting diodes (OLEDs) for displays and lighting. Its unique luminescence mechanism grants it advantages such as high efficiency, long operational lifespan, and a wide color gamut, potentially leading to substantial breakthroughs in the future. With increasing demands for energy efficiency and environmental sustainability, TADF dopant materials are poised to become a key driving force in the organic optoelectronics industry, propelling its continuous innovative development.

The global TADF Dopant Materials market size was estimated at USD 69.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
