Report Overview

Tailings are the waste materials that remain after the desired minerals have been extracted from the mined ore in a processing plant. They are typically composed of fine particles of sand, clay, and water. Tailings can pose a number of environmental risks, including:

Pollution of water bodies: Tailings can contaminate water bodies, such as rivers and lakes, with heavy metals and other pollutants. This can harm aquatic life and make the water unsafe for drinking and irrigation.

Sedimentation: Tailings can settle at the bottom of water bodies, blocking sunlight and suffocating aquatic life.

Landslides: Tailings dams can collapse, releasing tailings into the surrounding area. This can cause flooding, damage to property, and environmental contamination.
