## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Tailings Management Systems competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of tailings management systems is 16,400 sets, with an average price of US\$373,000 per set. A tailings management system (TMS) is a comprehensive approach to managing mine tailings, which are byproducts of mining operations. It encompasses the processes, technologies, and strategies used to safely store, treat, and monitor tailings throughout the mine's lifecycle, from initial feasibility to closure and post-closure. The primary goal is to prevent harm to people and the environment by minimizing risks and ensuring the long-term stability of tailings storage facilities. The upstream sector of the tailings management system industry chain primarily includes suppliers of core components such as mining machinery manufacturing, pumps, valves, and pipelines, automated control systems, filter cloths and pressurizing devices, chemical flocculants, and monitoring sensors. The midstream sector comprises tailings processing equipment and system integrators, including thickeners, filter presses, centrifugal dewatering units, tailings pumps, tailings dry discharge systems, and online monitoring and automated control systems. Companies in this segment not only provide equipment but also undertake tailings dam engineering design, system integration, installation and commissioning, and intelligent operation and maintenance services. Downstream applications are broad, primarily focused on metal ores (such as iron, copper, lead, zinc, and gold) and non-metallic ores (such as phosphate rock, quartz sand, and kaolin). With the expansion of mining operations and the advancement of green mining policies, tailings dry discharge, tailings reuse, and safety monitoring systems have become essential components of new and renovated mine projects. In recent years, national

regulations on tailings dam safety and ecological risk prevention have become increasingly stringent, requiring the development of a new "low-emission, tailings-free" mining model. Consequently, downstream mining companies generally prioritize tailings management systems when investing in new construction or technological upgrades.

**Development Trends**The trend toward intelligence is reflected in the widespread adoption of online monitoring and automatic control systems. Companies deploy level, turbidity, pressure, and displacement sensors to enable real-time monitoring, automatic alarms, and remote dispatch of tailings ponds. Dry-discharge technology, centered around high-efficiency thickeners and filter press dewatering equipment, achieves solid-liquid separation of tailings slurry followed by dry stacking, significantly reducing reservoir pressure and leakage risks. The resource utilization trend focuses on the comprehensive utilization of tailings, including the production of building aggregates, filling mined-out areas, brickmaking, and the recovery of rare and precious metals. Industry development opportunities are concentrated in two areas: first, policy-driven green mine construction and tailings pond remediation projects, generating new investment demand; second, the added value of tailings resource reuse and safety monitoring information services. According to the China Mining Association, there are approximately 12,000 tailings ponds nationwide, over half of which require upgrades or safety information systems, representing enormous market potential. However, industry development remains constrained by multiple challenges. First, the widely varying properties of mine tailings and their geographically dispersed distribution require customized design for system integration and equipment selection, resulting in high manufacturing and construction costs. Secondly, the initial investment in tailings dry discharge systems is large, and the payback period is long, placing significant financial pressure on some small and medium-sized mines. Thirdly, the industry faces high technical barriers, and thickening and dewatering equipment require long-term, stable operation to ensure safety. Domestic small and medium-sized enterprises still lag behind internationally advanced technologies in process control and system reliability. Furthermore, tailings pond management involves multiple regulatory bodies, including safety, environmental protection, and geology, leading to lengthy project approval cycles, which has also, to a certain extent, inhibited market expansion. Overall, the capacity utilization rate for tailings management system equipment manufacturing is approximately 65%–80%, with relatively low market concentration. However, the share of leading companies in large-scale mining projects is gradually increasing. The gross profit margin for a single filter press and thickening equipment unit is generally 20%–30%, while complete system integration projects (including installation, commissioning, and operation and maintenance services) can reach 30%–40%. Some high-end information-based monitoring and automatic control systems can even exceed 45%. In contrast, small and medium-sized manufacturers, which only provide stand-

alone equipment or supporting components, generally have gross profit margins below 20% and are significantly affected by fluctuations in raw material prices. As the country promotes mine safety management and green production transformation, the scale of industry investment is expected to maintain an average annual growth of 7%-9% in the next three to five years, and the proportion of high-end intelligent tailings management systems will increase significantly.

The global Tailings Management Systems market size was estimated at USD 6127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
