Abstracts

The tangential occlusion clamp is a specialized surgical instrument used primarily in vascular and cardiovascular procedures to temporarily occlude blood vessels during surgery, allowing surgeons to work on a bloodless field while minimizing trauma to the vessel walls. Its design typically features curved or angled jaws that apply controlled lateral pressure to the vessel, reducing the risk of intimal damage or endothelial injury compared to traditional straight clamps. These clamps are engineered for precision, often including atraumatic serrations or silicone coatings to prevent slippage and ensure secure occlusion without compromising blood flow upon release. They are essential in procedures such as coronary artery bypass grafting, aneurysm repairs, and other microvascular surgeries where delicate tissue handling and temporary hemostasis are critical.

The global Tangential Occlusion Clamp market size was estimated at USD 180.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
