Abstracts

Tantalum capacitors are a subtype of electrolytic capacitors. They are made of tantalum metal which acts as an anode, covered by a layer of oxide which acts as the dielectric, surrounded by a conductive cathode. The use of tantalum allows for a very thin dielectric layer. This results in a higher capacitance value per volume, superior frequency characteristics compared to many other types of capacitors and excellent stability over time. Tantalum capacitors are generally polarized, which means that they may only be connected to a DC supply observing the correct terminal polarity. The downside to using tantalum capacitors is their unfavorable failure mode which may lead to thermal runaway, fires and small explosions, but this can be prevented through the use of external failsafe devices such as current limiters or thermal fuses. Technology advances allow tantalum capacitors to be used in a wide variety of circuits, often found in laptops, automotive industry, cell phones and others, most often in the form of surface mounted devices (SMD). These surface mount tantalum capacitors claim much less space on the printed circuit board and allow for greater packing densities. Global Tantalum Capacitors key players include Kemet, Kyocera(AVX), Vishay, Panasonic, Hongda Electronics Corp, etc. Global top five players hold a share about 60%. Asia-Pacific is the largest market, with a share about 60%, followed by North America and Europe, having a total share about 35 percent. In terms of product, Ordinary Tantalum Capacitor is the largest segment, with a share about 90%. And in terms of application, the largest application is Consumer Electronics, followed by Automotive, Military or Aerospace, Medical.

The global Tantalum Capacitors market size was estimated at USD 2432.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
