## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Tantalum Niobium Metal Powder competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.

**Tantalum powder (Ta powder):** Tantalum is a rare metal that is resistant to high temperatures and corrosion, widely used in the manufacture of corrosion-resistant equipment, electronic components (such as capacitors), high-temperature alloys, and aerospace technology. Tantalum powder is commonly used to manufacture tantalum capacitors or as an additive in alloys.

**Niobium powder (Nb powder):** Niobium is also a high-temperature and corrosion-resistant metal commonly used in the manufacturing of superconducting materials, spacecraft, and electronic components. Niobium powder is generally used in the production of niobium alloys or as an alloying element for other metals, and has good oxidation resistance. Tantalum and niobium are resistant metals with melting points of 3017 °C and 2477 °C, respectively. As a dielectric, it can form an extremely thin but high-density oxide layer, making it an excellent material for capacitor anodes. Copper is used in semiconductor wiring, and using tantalum or tantalum nitride as a barrier layer is very effective in preventing copper from diffusing into the semiconductor layer. High purity and high-quality tantalum and niobium powders are used as additives to improve the corrosion resistance of turbine blades in aerospace and energy industries.

The global Tantalum Niobium Metal Powder market size was estimated at USD 236.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
