Abstracts

Targeted DNA sequencing refers to a specialized genomic analysis technique that selectively sequences specific regions of interest within a genome, rather than sequencing the entire genetic code, by using methods such as PCR amplification or hybridization capture to isolate predefined genes, exomes, or genomic loci for high-depth, cost-effective analysis. This approach allows researchers and clinicians to focus on known disease-associated variants, hereditary conditions, or biomarkers with greater efficiency, accuracy, and reduced data processing burden compared to whole-genome sequencing, making it particularly valuable in diagnostics, oncology, pharmacogenomics, and agricultural genomics where precision and scalability are critical.

The global Targeted Dna Sequencing market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Targeted Dna Sequencing market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
