Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Targeted Protein Degraders competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Targeted protein degraders are a promising class of drugs that have gained significant attention in recent years due to their potential to treat previously "undruggable" targets in diseases such as cancer. Protein degradation is the process by which proteins are naturally destroyed in a cell in order to maintain protein homeostasis, or an equilibrium of proteins in the human body. The body is constantly making and remaking proteins (creation), while also removing ones that have become inactive or mutated (degradation). When a cell is unable to degrade certain proteins, the proteins can accumulate, causing diseases like cancer. With targeted protein degradation, researchers are harnessing the cell's own machinery to degrade several whole new classes of proteins that were previously considered "undruggable." Scientists are leveraging three different modalities of targeted protein degradation - molecular glues, also called CELMoDTM agents, ligand-directed degraders (LDDs) and antibody drug conjugate (ADC) degraders. This three-pronged approach provides more opportunities for breakthroughs and therapeutic strategies that could one day offer meaningful new options for patients across a broad range of diseases including certain types of myeloma, lymphoma, solid tumors and myelodysplastic syndromes, as well as sickle cell disease.

The global Targeted Protein Degraders market size was estimated at USD 102.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.30% during the forecast period.
