Abstracts

TCAD (Technology Computer-Aided Design) is a numerical simulation platform developed based on semiconductor physics principles. Its core value lies in the digital simulation of semiconductor processes and device characteristics through computer modeling. The system can accurately simulate the complete process from doping diffusion to etching deposition, and can predict the electrical characteristics of devices under different structural designs, thereby significantly reducing the high cost and time consumption of traditional process tests. At the same time, TCAD supports systematic optimization of device parameters, and can conduct forward-looking evaluation of circuit performance indicators and potential electrical defects, providing key technical support for semiconductor process development and device design. OPC (Optical Proximity Correction) is a graphic correction technology for photolithography. It intelligently optimizes the graphic layout on the mask by establishing a comprehensive simulation model that includes optical diffraction effects and photoresist chemical reactions. This technology uses an iterative calculation method to continuously adjust the geometric shape of the mask pattern to compensate for the graphic distortion caused by the optical proximity effect during the photolithography process, and finally achieves a graphic transfer effect on the silicon wafer that is highly consistent with the design layout. This simulation-based intelligent correction method effectively solves the problem of graphic fidelity in nanoscale processes and significantly shortens the R&D cycle of advanced lithography processes.

The global TCAD and OPC Tools market size was estimated at USD 1951.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.30% during the forecast period.
