Thermo Compression Attach. Using this technique, there are no adhesives to join the die and the package. Instead, heat and force are applied to the die in a process called "Thermo Compression Bonding". The bumps are forced against their opposing pads and a second metallic bond is formed where the bond comes into contact with the package metallization. This technique typically requires the use of heat as high as 350? to 400?C, and forces of as much as 100 g/bump. The market size continues to expand, with the Asia-Pacific region leading the growth. Drivers: The surge in demand for advanced packaging (such as 3D IC and Chiplet) in fields like 5G communication, high-performance computing (HPC), and automotive electronics is driving the growth in demand for bonding machines. Technological Upgrades: Automation and high precision are becoming mainstream. High-precision alignment: The accuracy of optical alignment systems has improved to ?1?m, meeting the requirements for tiny solder joints in advanced packaging. Low-temperature bonding technology: Reduces thermal stress damage, suitable for sensitive devices like flexible electronics and MEMS. Multi-material compatibility: Supports bonding of heterogeneous materials such as metals, ceramics, and polymers, expanding application scenarios. Market Competition Landscape: High concentration, with accelerated domestic substitution. Increased localization rate: Policy support combined with the expansion of local semiconductor production capacity (e.g., demand from SMIC and Tongfu Microelectronics) is driving the substitution of domestic equipment for imports. Expansion of application areas: Advanced packaging and emerging demands. Semiconductor packaging: Flip Chip, Wafer Level Packaging (WLP), and 3D IC integration have the highest demand for thermal compression bonding machines. MEMS and sensors: The need for hermetic packaging is driving the application of bonding machines in automotive electronics and the Internet of Things. Flexible electronics: The demand for low-temperature bonding technology is growing in the manufacturing of wearable devices and flexible screens. Power devices:

The packaging of silicon carbide (SiC) and gallium nitride (GaN) devices relies on high-reliability bonding processes. The thermal compression bonding machine industry will exhibit characteristics of "technological refinement, market regionalization, and competitive differentiation." As the autonomy of China's semiconductor industry chain accelerates, domestic equipment is expected to achieve overtaking in niche areas (such as thermosonic bonding and flexible electronic packaging), while remaining vigilant about risks from international trade friction and supply chain fluctuations.
