### Report Overview

Temperature compensated crystal oscillators and voltage controlled temperature compensated crystal oscillators are electronic devices based on the crystal oscillator technology and are used to provide stable frequency signals. The temperature compensated crystal oscillator uses a temperature sensor and a temperature compensation circuit to offset changes in the crystal oscillator frequency at different temperatures. The voltage controlled temperature compensated crystal oscillator combines the characteristics of a voltage controlled oscillator and a temperature compensated crystal oscillator. It adjusts the frequency of the oscillator by changing the control voltage, and uses temperature compensation technology to offset frequency drift caused by temperature changes. By controlling the input voltage, precise control of the output frequency can be achieved and stability at different temperatures can be maintained.
