Report Overview:

Tunable diode laser absorption spectroscopy (TDLAS, sometimes referred to as TDLS, TLS or TLAS) is a technique for measuring the concentration of certain species such as methane, water vapor and many more, in a gaseous mixture using tunable diode lasers and laser absorption spectrometry. The advantage of TDLAS over other techniques for concentration measurement is its ability to achieve very low detection limits (of the order of ppb). Apart from concentration, it is also possible to determine the temperature, pressure, velocity and mass flux of the gas under observation. TDLAS is by far the most common laser based absorption technique for quantitative assessments of species in gas phase.

Tunable Diode Laser Analyzer (TDLA) (TDL analyzer) is a device used in measuring and identifying the amount of water, methane, carbon dioxide in various gas mixtures. The Tunable laser analyzer consists of transmitting optics, light source, receiving optics, gas absorption. The TDL analyzer can help in detecting HCL, O₂, HF, CO, NH₃, CO₂, N₂O, H₂O, NO₂, NO, and CH₄. The TDL analyzer is ideal for making cross-section measurements and combustion control application in power generation and hydrocarbon processing.

The Global TDLAS Based Gas Analyser Market Size was estimated at USD 106.33 million in 2023 and is projected to reach USD 126.97 million by 2029, exhibiting a CAGR of 3.00% during the forecast period.
