## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on TDMAHf Precursor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Tetrakis (dimethylamino) hafnium (TDMAH) is an organometallic compound composed of a central hafnium atom (Hf) and four surrounding dimethylamino ligands (NMe<sub>2</sub>). The physical and chemical properties of four (dimethylamino) hafnium compounds are suitable for CVD and ALD, and they are a class of materials that are increasingly being studied as precursors for depositing hafnium. Hafnium oxygen thin film is likely to be used as a candidate high dielectric constant insulating layer material in COMS and next-generation DRAM. Usually, CVD or ALD are used to obtain hafnium oxide thin films. Firstly, a gas-phase hafnium precursor is introduced and attached to the wafer surface for chemical reactions.

The global TDMAHf Precursor market size was estimated at USD 88.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
