## Abstracts

### Report Overview:

Telecentric Camera Objective is a compound lens that has its entrance or exit pupil at infinity; in the prior case, this produces an orthographic view of the subject. This means that the chief rays (oblique rays that pass through the center of the aperture stop) are parallel to the optical axis in front of or behind the system, respectively. The simplest way to make a lens telecentric is to put the aperture stop at one of the lens's focal points. Such lenses are used in machine vision systems because image magnification is independent of the object's distance or position in the field of view.

The Global Telecentric Camera Objective Market Size was estimated at USD 123.15 million in 2023 and is projected to reach USD 177.67 million by 2029, exhibiting a CAGR of 6.30% during the forecast period.
