Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Telechelic Copolymers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Telechelic copolymers are a class of copolymers that possess reactive functional groups (known as "telechelic" end groups) at both chain ends. These functional end groups—such as hydroxyl (OH), amine (NH₂), carboxyl (COOH), or isocyanate (NCO)—allow for further chemical modification, crosslinking, or block copolymer formation. The main polymer backbone is composed of two or more types of monomer units (making it a copolymer), while the telechelic nature enables these materials to act as versatile precursors or intermediates in the synthesis of advanced polymer architectures. They are widely used in creating block copolymers, thermoplastic elastomers, polyurethane prepolymers, and network polymers for adhesives, coatings, and biomedical applications due to their tailorability and controlled reactivity.

The global Telechelic Copolymers market size was estimated at USD 2384.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
