## Abstracts

Telecom site management software is a specialized digital solution designed to streamline and optimize the entire lifecycle of telecommunications sites. It integrates a wide range of functions crucial for efficient site operations. This software enables comprehensive site planning, from initial site selection and layout design to detailed project scheduling during construction. It also manages the vast inventory of telecom assets, tracking equipment installation, maintenance, and upgrades, ensuring optimal performance and minimizing downtime. In terms of operations, it provides real - time monitoring of site parameters such as signal strength, power consumption, and equipment health, triggering alerts for any anomalies. Additionally, it handles lease agreements with landlords, manages billing processes for tenants, and coordinates field personnel through work order assignment and tracking. By centralizing these diverse tasks, telecom site management software enhances operational efficiency, reduces costs, improves communication among stakeholders, and ultimately ensures the reliable and continuous operation of telecommunications infrastructure. The continuous increase in the number of connected devices and data traffic, as well as the large - scale deployment of 5G networks, require advanced network management solutions. 5G networks have complex architectures and high - speed data transmission characteristics, which need sophisticated management tools to ensure network performance, fault tolerance, and security. Cloud - based network management solutions have the advantages of scalability, cost - effectiveness, and easy integration with existing systems, and can facilitate remote network monitoring and management. With the normalization of remote work and digital transformation in various industries, the demand for cloud - based solutions is increasing. The integration of artificial intelligence (AI), the Internet of Things (IoT) and other technologies into telecom networks has created new development opportunities for the market. AI - powered solutions can analyze network data in real - time, predict potential problems, and

automate routine tasks, while IoT devices generate a large amount of data that needs to be managed, both of which promote the growth of the market.
