Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Telescopic Hedge Shears competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of telescopic hedge shears was approximately 8-12 million units, with an average selling price of about \$20-\$300 per unit and a gross profit margin of about 40%. A single production line had a capacity of approximately 70,000-100,000 units per year. The main feature of telescopic hedge trimmers is their adjustable handle length, designed to allow users to easily and safely trim hedges and shrubs located in high or hard-to-reach areas without the need for ladders or footstools. The upstream mainly consists of suppliers of raw materials (such as aluminum alloy tubing and high-carbon steel blades) and components (locking clips, springs, and plastic handles); the midstream comprises manufacturing and assembly plants responsible for processing materials into telescopic rods, forging and sharpening blades, and completing the final assembly, testing, and packaging of the product; the downstream reaches end users through garden tool distributors, building material supermarkets, online e-commerce platforms, and other channels. The demand primarily stems from the strong need among home gardening enthusiasts and professional gardeners to safely and efficiently prune tall hedges. The core driving factors are avoiding the risks of climbing, improving pruning efficiency, and meeting the rigid demand for labor-saving gardening tools in the context of an aging society.

The global Telescopic Hedge Shears market size was estimated at USD 1000.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
