### Report Overview

Telescopic Hydraulic Cylinders, at times called as multi-stage cylinders, are a type of linear actuator consisting of a series of tubular rods called sleeves. The sleeves (usually four or five) sequentially decrease in diameter and are nested inside of each other. When hydraulic pressure is introduced to the cylinder, the largest sleeve (called the main or barrel) is extended first. After the barrel has reached its maximum stroke, the next sleeve, typically referred to as a stage, begins to extend. This process continues until the cylinder reaches its last stage, called the plunger.
