Report Overview:

Transmission Electron Microscope (TEM) is a large-scale microscopic analysis equipment that uses high-energy electron beams as illumination sources for magnified imaging. In 1933, German scientists Ruska and Knoll developed the world's first transmission electron microscope. In 1939, Siemens took this electron microscope as a prototype and mass-produced it. The first batch of commercial transmission electron microscopes, about 40 sets, the resolving power is 20 times higher than that of optical microscopes. Since then, human beings have more powerful weapons for scientific research on the microcosm. Today, the transmission electron microscope has been born for more than 70 years. The interdisciplinary subject formed by the application of the electron microscope-electron microscopy has been perfected day by day, and the resolving power of the electron microscope has increased by more than 100 times compared with the original, reaching the sub-Angstrom level. And play an increasingly important role in natural science research.

Cameras are used to render an image from the electrons striking a sensor. There are different types of cameras which can be used with an EM, dependent on the precise application and the type of specimen used.

The Global TEM Cameras Market Size was estimated at USD 157.18 million in 2023 and is projected to reach USD 269.46 million by 2029, exhibiting a CAGR of 9.40% during the forecast period.
