Report Overview

TEM is capable of unparalleled resolution due to the small wavelength of the transmitted electrons. Unlike scanning electron microscopy (SEM), which gathers the net intensity of secondary electrons in each point of the scan, TEM resolution is only limited by the wavelength of the individual electron and the quality of the electron optics. This means that transmission electron microscopes can routinely collect sub-nanometer scale (if not atomic-resolution) images.

The global Tem Imaging And Spectroscopy Equipment market size was estimated at USD 985.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
