Report Overview

For routine transmission electron microscopy (TEM), it is generally accepted that specimens should be thin, dry and contain molecules which diffract electrons. Biological specimens, which are large and consist of large amounts of water, also do not diffract electrons and are therefore difficult to see in the TEM. Preparing biological specimens for the TEM, whilst retaining the structural morphology of the material, is a challenge.

The global Tem Specimen Preparation Equipment market size was estimated at USD 185.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
