Abstracts

Tembotrione is a triketone HPPD inhibitor herbicide synthesized by adding trifluoroethoxy to the structure of sulfotrione. Due to the intervention of multiple fluorine atoms, the hydrophobicity (or lipophilicity), membrane permeability, anti-metabolic stability, volatility, thermal stability and chemical stability of the compound are increased, resulting in its activity being higher than sulfotrione and mesotrione. Compared with other varieties, cyclosulfuron has a strong killing effect on a variety of weeds, no residual activity, strong resistance to rain erosion, and a wider weed control spectrum.

The global Tembotrione Herbicide market size was estimated at USD 344.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
