Report Overview

Temperature-controlling textiles are advanced fabrics designed to regulate the wearer's body temperature by either absorbing, storing, or releasing heat as needed. These textiles often incorporate phase change materials (PCMs) that respond to temperature fluctuations by changing their physical state, such as from solid to liquid, to absorb excess heat or release stored heat when the temperature drops. Additionally, some temperature-controlling textiles use specialized fibers or coatings that improve thermal insulation or enhance moisture management, contributing to better temperature regulation. These fabrics are commonly used in sportswear, outdoor gear, bedding, and medical applications, where maintaining an optimal temperature is crucial for comfort, performance, or health. By adapting to environmental conditions and the wearer's activity level, temperature-controlling textiles help maintain a stable and comfortable microclimate next to the skin.
