Abstracts

Temporary pacing catheters are specialized medical devices designed for short-term cardiac pacing, typically inserted transvenously to provide electrical stimulation to the heart in acute care settings. These catheters serve as a critical intervention for patients experiencing bradyarrhythmias, heart block, or asystole, often following cardiac surgery, myocardial infarction, or during diagnostic procedures. They are intended for temporary use, ranging from hours to several days, and are characterized by features such as bipolar or unipolar electrode configurations, fluoroscopic visibility, and compatibility with external pulse generators. The devices are employed when permanent pacemaker implantation is not immediately indicated or when bridging is required, emphasizing rapid deployment, stability, and minimal complication risk during their limited indwell time.

The global Temporary Pacing Catheters market size was estimated at USD 120.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
