Abstracts

Temporary pacing electrodes are specialized medical devices used in cardiac care to provide short-term electrical stimulation to the heart, typically in perioperative or critical care settings where temporary control of heart rhythm is required. These electrodes are designed for external or minimally invasive placement, often via transvenous, epicardial, or transcutaneous routes, and are connected to an external pulse generator to regulate heart rate in patients experiencing bradycardia, heart block, or other arrhythmias. Unlike permanent pacemakers, these devices are intended for temporary use?ranging from hours to several days?and are removed once the patient?s condition stabilizes or a permanent solution is implemented. They play a crucial role in bridging cardiac instability, particularly after cardiac surgery, during acute myocardial infarction, or while managing drug toxicity or metabolic disturbances affecting heart rhythm.

The global Temporary Pacing Electrodes market size was estimated at USD 120.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
