Abstracts

Terahertz imaging cameras are advanced devices that operate within the terahertz frequency range (0.1-10 THz), a segment of the electromagnetic spectrum situated between microwaves and infrared light; these cameras utilize the unique properties of terahertz radiation—such as its ability to penetrate many non-conductive materials like clothing, paper, plastics, and ceramics while being non-ionizing and safe for biological tissues—to generate high-resolution images that reveal hidden or internal structures, making them invaluable for applications in security screening (detecting concealed weapons or explosives), non-destructive testing (inspecting materials and components for defects without causing damage), medical diagnostics (imaging skin cancers or dental issues), and scientific research (studying molecular properties).

The global Terahertz Imaging Cameras market size was estimated at USD 95.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.50% during the forecast period.
